Frequently Asked Manual Software Testing Interview Questions with Answers

1) What is difference between bug, error and defect?
Bug and defect essentially mean the same. It is the flaw in a component or system, which can cause the component or system to fail to perform its required function. If a bug or defect is encountered during the execution phase of the software development, it can cause the component or the system to fail. On the other hand, an error is a human error, which gives rise to incorrect result. You may want to know about, how to log a bug (defect), contents of a bug, bug life cycle, and bug and statuses used during a bug life cycle, which help you in understanding the terms bug and defect better.

2) Explain white box testing
One of the testing types used in software testing is white box testing. Read in detail on white box testing.

3) Tell me about V model in manual testing
V model is a framework, which describes the software development life cycle activities right from requirements specification up to software maintenance phase. Testing is integrated in each of the phases of the model. The phases of the model start with user requirements and are followed by system requirements, global design, detailed design, implementation and ends with system testing of the entire system. Each phase of model has the respective testing activity integrated in it and is carried out parallel to the development activities. The four test levels used by this model include, component testing, integration testing, system testing and acceptance testing.

4) What are stubs and drivers in manual testing?
Both stubs and drivers are a part of incremental testing. There are two approaches, which are used in incremental testing, namely bottom up and top down approach. Drivers are used in bottom up testing. They are modules, which test the components to be tested. The look of the drivers is similar to the future real modules. Tell me the key elements consider when writing an error report.An ideal bug report should consist of the following key points: Description of a unique ID defect: Brief description of the error Steps to reproduce: These include detailed test steps to emulate the problem. Small versions like like Packages include a lower error correction. The process includes the following activities: Inspections Rentals Demés Validation is a means to confirm that the developed product does not have any failure and works as expected. A software program may require too many entrances, departures and combinations of routes. But we must document all assumptions well in the test plan. It is favorable since it does not require the development team to complete the encoding to start QA. Next, some of the main challenges of software tests are presented: the lack of availability of standard documents to understand the application Lack of qualified evaluators Comprehension of the requirements: The evaluators require a good listening capacity and understanding to communicate The requirements of the application. What is the average age of a defect in software tests? The age of the defect is the time elapsed between the day in which the tester discovered a defect and the day in which the developer fixed it. The complete documentation of the test reports will help analyze the different phases of the project. Can we perform system tests at any time? What is the purpose of end-to-end testing?End-to-end testing is a testing strategy for running tests that cover all possible flows of an application from start to finish. 16. Why is it impossible to test a program thoroughly?These are the two main reasons that make it impossible to test a program completely. However, it must be done before UAT (user acceptance test). The software is treated as a black box ³ is validated according to the Â end user Â point of view. But, the regression test ensures that the error correction does not break other parts of the application. P9.
